CSL offer clients new 3D system design from AutoLogic Systems

Conveyor Systems Ltd., the automated handling and logistics experts, have invested in the most advanced 3-dimensional modelling software from AutoLogic Systems.

Conveyor Systems Ltd. (CSL) will use Demo3D software to expand its design capability to accurately model any proposed conveyor system, and demonstrate the performance of complex materials handling systems.

The Senior Proposals Manager at CSL reported: "Demo3D not only adds a new dimension to our design capabilities, it provides an excellent communications tool enabling us to demonstrate to clients realistic models of materials handling and manufacturing systems that allows them to evaluate proposals in real time.

"It enables us to provide significantly more detailed information about a system and reduces the risk of any possible 'grey areas' in the design process - particularly in areas such as throughputs and product classification by highlighting potential problem areas. The software enables CSL to accurately simulate and predict the behaviour of a system, whilst also allowing us the flexibility to quickly change weights, material and frictional properties of products being handled. The visuals can also be customised to incorporate the clients own conveyor profiles, colours and textured finishes in order to provide a very realistic concept of how the final system will appear."

The software allows CSL to dramatically reduce the time taken to design and construct a working model by easily linking individual modules within a system. It is also possible to demonstrate specific parts of the system and where necessary, quickly and cost effectively make necessary changes to the specification.

High resolution images and video clips can be taken from the model and presented to the customer and can even be used to support internal communication and training.

"Demo3D has proven to be an invaluable, highly efficient design tool for CSL."

About AutoLogic Systems Ltd

Founded in 1993, AutoLogic Systems Ltd provides specialist software for all stages of the supply chain including: optimisation of pallet, case and package design; container & vehicle load planning; manufacturing and warehouse simulation; optimisation of process variables; and vehicle scheduling and tracking.
